

ABSTRACT

An operation input device of a vehicle capable of operating the vehicle by allowing an operation input into the vehicle even when an active reaction part (3) is not operated. In one embodiment of this invention, the device comprises an operation input part (1) receiving an operational force, the active reaction part (3) generating, against an applied operating force, a reaction by an electrical control in the operation input part (1), and an active reaction releasing part (4) opening a force transmission route between the active reaction part (3) and the operation input part (1).
